# Brahmagupta Quadrilaterals 

K. R. S. Sastry

#### Abstract

The Indian mathematician Brahmagupta made valuable contributions to mathematics and astronomy. He used Pythagorean triangles to construct general Heron triangles and cyclic quadrilaterals having integer sides, diagonals, and area, i.e., Brahmagupta quadrilaterals. In this paper we describe a new numerical construction to generate an infinite family of Brahmagupta quadrilaterals from a Heron triangle.

## 1. Introduction

A triangle with integer sides and area is called a Heron triangle. If some of these elements are rationals that are not integers then we call it a rational Heron triangle. More generally, a polygon with integer sides, diagonals and area is called a Heron polygon. A rational Heron polygon is analogous to a rational Heron triangle. Brahmagupta's work on Heron triangles and cyclic quadrilaterals intrigued later mathematicians. This resulted in Kummer's complex construction to generate Heron quadrilaterals outlined in [2]. By a Brahmagupta quadrilateral we mean a cyclic Heron quadrilateral. In this paper we give a construction of Brahmagupta quadrilaterals from rational Heron triangles.

We begin with some well known results from circle geometry and trigonometry for later use.

Figure 1

Figure 2

Figure 1 shows a chord $A B$ of a circle of radius $R$. Let $C$ and $C$ be points of the circle on opposite sides of $A B$. Then,

$$
\begin{align*}
& \angle A C B+\angle A C^{\prime} B=\pi \\
& A B=2 R \sin \theta \tag{1}
\end{align*}
$$

Publication Date: December 9, 2002. Communicating Editor: Paul Yiu.
The author thanks Paul Yiu for the help rendered in the preparation of this paper.

Throughout our discussion on Brahmagupta quadrilaterals the following notation remains standard. $A B C D$ is a cyclic quadrilateral with vertices located on a circle in an order. $A B=a, B C=b, C D=c, D A=d$ represent the sides or their lengths. Likewise, $A C=e, B D=f$ represent the diagonals. The symbol $\triangle$ represents the area of $A B C D$. Brahmagupta's famous results are

$$
\begin{align*}
& e=\sqrt{\frac{(a c+b d)(a d+b c)}{a b+c d}},  \tag{2}\\
& f=\sqrt{\frac{(a c+b d)(a b+c d)}{a d+b c}},  \tag{3}\\
& \triangle=\sqrt{(s-a)(s-b)(s-c)(s-d)}, \tag{4}
\end{align*}
$$

where $s=\frac{1}{2}(a+b+c+d)$.
We observe that $d=0$ reduces to Heron's famous formula for the area of triangle in terms of $a, b, c$. In fact the reader may derive Brahmagupta's expressions in (2), (3), (4) independently and see that they give two characterizations of a cyclic quadrilateral. We also observe that Ptolemy's theorem, viz., the product of the diagonals of a cyclic quadrilateral equals the sum of the products of the two pairs of opposite sides, follows from these expressions. In the next section, we give a construction of Brahmagupta quadrilaterals in terms of Heron angles. A Heron angle is one with rational sine and cosine. See [4]. Since

$$
\sin \theta=\frac{2 t}{1+t^{2}}, \quad \cos \theta=\frac{1-t^{2}}{1+t^{2}},
$$

for $t=\tan \frac{\theta}{2}$, the angle $\theta$ is Heron if and only $\tan \frac{\theta}{2}$ is rational. Clearly, sums and differences of Heron angles are Heron angles. If we write, for triangle $A B C$, $t_{1}=\tan \frac{A}{2}, t_{2}=\tan \frac{B}{2}$, and $t_{3}=\tan \frac{C}{2}$, then

$$
a: b: c=t_{1}\left(t_{2}+t_{3}\right): t_{2}\left(t_{3}+t_{1}\right): t_{3}\left(t_{1}+t_{2}\right) .
$$

It follows that a triangle is rational if and only if its angles are Heron.

## 2. Construction of Brahmagupta quadrilaterals

Since the opposite angles of a cyclic quadrilateral are supplementary, we can always label the vertices of one such quadrilateral $A B C D$ so that the angles $A, B \leq$ $\frac{\pi}{2}$ and $C, D \geq \frac{\pi}{2}$. The cyclic quadrilateral $A B C D$ is a rectangle if and only if $A=B=\frac{\pi}{2}$; it is a trapezoid if and only if $A=B$. Let $\angle C A D=\angle C B D=\theta$. The cyclic quadrilateral $A B C D$ is rational if and only if the angles $A, B$ and $\theta$ are Heron angles.

If $A B C D$ is a Brahmagupta quadrilateral whose sides $A D$ and $B C$ are not parallel, let $E$ denote their intersection. ${ }^{1}$ In Figure 3, let $E C=\alpha$ and $E D=\beta$. The triangles $E A B$ and $E C D$ are similar so that $\frac{A B}{C D}=\frac{E B}{E D}=\frac{E A}{E C}=\lambda$, say.

[^0]

Figure 3

That is,

$$
\frac{a}{c}=\frac{\alpha+b}{\beta}=\frac{\beta+d}{\alpha}=\lambda,
$$

or

$$
\begin{equation*}
a=\lambda c, \quad b=\lambda \beta-\alpha, \quad d=\lambda \alpha-\beta, \quad \lambda>\max \left(\frac{\alpha}{\beta}, \frac{\beta}{\alpha}\right) . \tag{5}
\end{equation*}
$$

Furthermore, from the law of sines, we have

$$
\begin{equation*}
e=2 R \sin B=2 R \sin D=\frac{R}{\rho} \cdot \alpha, \quad f=2 R \sin A=2 R \sin C=\frac{R}{\rho} \cdot \beta . \tag{6}
\end{equation*}
$$

where $\rho$ is the circumradius of triangle $E C D$. Ptolemy's theorem gives $a c+b d=$ $e f$, and

$$
\frac{R^{2}}{\rho^{2}} \cdot \alpha \beta=c^{2} \lambda+(\beta \lambda-\alpha)(\alpha \lambda-\beta)
$$

This equation can be rewritten as

$$
\begin{aligned}
\left(\frac{R}{\rho}\right)^{2} & =\lambda^{2}-\frac{\alpha^{2}+\beta^{2}-c^{2}}{\alpha \beta} \lambda+1 \\
& =\lambda^{2}-2 \lambda \cos E+1 \\
& =(\lambda-\cos E)^{2}+\sin ^{2} E,
\end{aligned}
$$

or

$$
\left(\frac{R}{\rho}-\lambda+\cos E\right)\left(\frac{R}{\rho}+\lambda-\cos E\right)=\sin ^{2} E .
$$

Note that $\sin E$ and $\cos E$ are rational since $E$ is a Heron angle. In order to obtain rational values for $R$ and $\lambda$ we put

$$
\begin{aligned}
& \frac{R}{\rho}-\lambda-\cos E=t \sin E \\
& \frac{R}{\rho}+\lambda+\cos E=\frac{\sin E}{t}
\end{aligned}
$$

for a rational number $t$. From these, we have

$$
\begin{aligned}
R & =\frac{\rho}{2} \sin E\left(t+\frac{1}{t}\right)=\frac{c}{4}\left(t+\frac{1}{t}\right), \\
\lambda & =\frac{1}{2} \sin E\left(\frac{1}{t}-t\right)-\cos E .
\end{aligned}
$$

From the expression for $R$, it is clear that $t=\tan \frac{\theta}{2}$. If we set

$$
t_{1}=\tan \frac{D}{2} \quad \text { and } \quad t_{2}=\tan \frac{C}{2}
$$

for the Heron angles $C$ and $D$, then

$$
\cos E=\frac{\left(t_{1}+t_{2}\right)^{2}-\left(1-t_{1} t_{2}\right)^{2}}{\left(1+t_{1}^{2}\right)\left(1+t_{2}^{2}\right)}
$$

and

$$
\sin E=\frac{2\left(t_{1}+t_{2}\right)\left(1-t_{1} t_{2}\right)}{\left(1+t_{1}^{2}\right)\left(1+t_{2}^{2}\right)}
$$

By choosing $c=t\left(1+t_{1}^{2}\right)\left(1+t_{2}^{2}\right)$, we obtain from (6)

$$
\alpha=\frac{t t_{1}\left(1+t_{1}^{2}\right)\left(1+t_{2}^{2}\right)^{2}}{\left(t_{1}+t_{2}\right)\left(1-t_{1} t_{2}\right)}, \quad \beta=\frac{t t_{2}\left(1+t_{1}^{2}\right)^{2}\left(1+t_{2}^{2}\right)}{\left(t_{1}+t_{2}\right)\left(1-t_{1} t_{2}\right)},
$$

and from (5) the following simple rational parametrization of the sides and diagonals of the cyclic quadrilateral:

$$
\begin{aligned}
a & =\left(t\left(t_{1}+t_{2}\right)+\left(1-t_{1} t_{2}\right)\right)\left(t_{1}+t_{2}-t\left(1-t_{1} t_{2}\right)\right), \\
b & =\left(1+t_{1}^{2}\right)\left(t_{2}-t\right)\left(1+t t_{2}\right), \\
c & =t\left(1+t_{1}^{2}\right)\left(1+t_{2}^{2}\right), \\
d & =\left(1+t_{2}^{2}\right)\left(t_{1}-t\right)\left(1+t t_{1}\right), \\
e & =t_{1}\left(1+t^{2}\right)\left(1+t_{2}^{2}\right), \\
f & =t_{2}\left(1+t^{2}\right)\left(1+t_{1}^{2}\right) .
\end{aligned}
$$

This has area

$$
\triangle=t_{1} t_{2}\left(2 t\left(1-t_{1} t_{2}\right)-\left(t_{1}+t_{2}\right)\left(1-t^{2}\right)\right)\left(2\left(t_{1}+t_{2}\right) t+\left(1-t_{1} t_{2}\right)\left(1-t^{2}\right)\right),
$$

and is inscribed in a circle of diameter

$$
2 R=\frac{\left(1+t_{1}^{2}\right)\left(1+t_{2}^{2}\right)\left(1+t^{2}\right)}{2} .
$$

Replacing $t_{1}=\frac{n}{m}, t_{2}=\frac{q}{p}$, and $t=\frac{v}{u}$ for integers $m, n, p, q, u, v$ in these expressions, and clearing denominators in the sides and diagonals, we obtain Brahmagupta quadrilaterals. Every Brahmagupta quadrilateral arises in this way.

## 3. Examples

Example 1. By choosing $t_{1}=t_{2}=\frac{n}{m}$ and putting $t=\frac{v}{u}$, we obtain a generic Brahmagupta trapezoid:

$$
\begin{aligned}
a & =\left(m^{2} u-n^{2} u+2 m n v\right)\left(2 m n u-m^{2} v+n^{2} v\right), \\
b=d & =\left(m^{2}+n^{2}\right)(n u-m v)(m u+n v), \\
c & =\left(m^{2}+n^{2}\right)^{2} u v, \\
e=f & =m n\left(m^{2}+n^{2}\right)\left(u^{2}+v^{2}\right),
\end{aligned}
$$

This has area
$\triangle=2 m^{2} n^{2}(n u-m v)(m u+n v)((m+n) u-(m-n) v)((m+n) v-(m-n) u)$, and is inscribed in a circle of diameter

$$
2 R=\frac{\left(m^{2}+n^{2}\right)^{2}\left(u^{2}+v^{2}\right)}{2}
$$

The following Brahmagupta trapezoids are obtained from simple values of $t_{1}$ and $t$, and clearing common divisors.

| $t_{1}$ | $t$ | $a$ | $b=d$ | $c$ | $e=f$ | $\triangle$ | $2 R$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $1 / 2$ | $1 / 7$ | 25 | 15 | 7 | 20 | 192 | 25 |
| $1 / 2$ | $2 / 9$ | 21 | 10 | 9 | 17 | 120 | 41 |
| $1 / 3$ | $3 / 14$ | 52 | 15 | 28 | 41 | 360 | 197 |
| $1 / 3$ | $3 / 19$ | 51 | 20 | 19 | 37 | 420 | 181 |
| $2 / 3$ | $1 / 8$ | 14 | 13 | 4 | 15 | 108 | $65 / 4$ |
| $2 / 3$ | $3 / 11$ | 21 | 13 | 11 | 20 | 192 | 61 |
| $2 / 3$ | $9 / 20$ | 40 | 13 | 30 | 37 | 420 | $1203 / 4$ |
| $3 / 4$ | $2 / 11$ | 25 | 25 | 11 | 30 | 432 | 61 |
| $3 / 4$ | $1 / 18$ | 17 | 25 | 3 | 26 | 240 | $325 / 12$ |
| $3 / 5$ | $2 / 9$ | 28 | 17 | 12 | 25 | 300 | $164 / 3$ |

Example 2. Let $E C D$ be the rational Heron triangle with $c: \alpha: \beta=14: 15: 13$. Here, $t_{1}=\frac{2}{3}, t_{2}=\frac{1}{2}$ (and $t_{3}=\frac{4}{7}$ ). By putting $t=\frac{v}{u}$ and clearing denominators, we obtain Brahmagupta quadrilaterals with sides
$a=(7 u-4 v)(4 u+7 v), b=13(u-2 v)(2 u+v), c=65 u v, d=5(2 u-3 v)(3 u+2 v)$, diagonals

$$
e=30\left(u^{2}+v^{2}\right), \quad f=26\left(u^{2}+v^{2}\right),
$$

and area

$$
\triangle=24\left(2 u^{2}+7 u v-2 v^{2}\right)\left(7 u^{2}-8 u v-7 v^{2}\right) .
$$

If we put $u=3, v=1$, we generate the particular one:

$$
(a, b, c, d, e, f ; \triangle)=(323,91,195,165,300,260 ; 28416) .
$$

On the other hand, with $u=11, v=3$, we obtain a quadrilateral whose sides and diagonals are multiples of 65 . Reduction by this factor leads to

$$
(a, b, c, d, e, f ; \triangle)=(65,39,33,25,52,60 ; 1344) .
$$

This is inscribed in a circle of diameter 65. This latter Brahmagupta quadrilateral also appears in Example 4 below.

Example 3. If we take $E C D$ to be a right triangle with sides $C D: E C: E D=$ $m^{2}+n^{2}: 2 m n: m^{2}-n^{2}$, we obtain

$$
\begin{aligned}
a & =\left(m^{2}+n^{2}\right)\left(u^{2}-v^{2}\right), \\
b & =((m-n) u-(m+n) v)((m+n) u+(m-n) v), \\
c & =2\left(m^{2}+n^{2}\right) u v, \\
d & =2(n u-m v)(m u+n v), \\
e & =2 m n\left(u^{2}+v^{2}\right), \\
f & =\left(m^{2}-n^{2}\right)\left(u^{2}+v^{2}\right) ; \\
\triangle & =m n\left(m^{2}-n^{2}\right)\left(u^{2}+2 u v-v^{2}\right)\left(u^{2}-2 u v-v^{2}\right) .
\end{aligned}
$$

Here, $\frac{u}{v}>\frac{m}{n}, \frac{m+n}{m-n}$. We give two very small Brahmagupta quadrilaterals from this construction.

| $n / m$ | $v / u$ | $a$ | $b$ | $c$ | $d$ | $e$ | $f$ | $\triangle$ | $2 R$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $1 / 2$ | $1 / 4$ | 75 | 13 | 40 | 36 | 68 | 51 | 966 | 85 |
| $1 / 2$ | $1 / 5$ | 60 | 16 | 25 | 33 | 52 | 39 | 714 | 65 |

Example 4. If the angle $\theta$ is chosen such that $A+B-\theta=\frac{\pi}{2}$, then the side $B C$ is a diameter of the circumcircle of $A B C D$. In this case,

$$
t=\tan \frac{\theta}{2}=\frac{1-t_{3}}{1+t_{3}}=\frac{t_{1}+t_{2}-1+t_{1} t_{2}}{t_{1}+t_{2}+1-t_{1} t_{2}} .
$$

Putting $t_{1}=\frac{n}{m}, t_{2}=\frac{q}{p}$, and $t=\frac{(m+n) q-(m-n) p}{(m+n) p-(m-n) q}$, we obtain the following Brahmagupta quadrilaterals.

$$
\begin{aligned}
a & =\left(m^{2}+n^{2}\right)\left(p^{2}+q^{2}\right), \\
b & =\left(m^{2}-n^{2}\right)\left(p^{2}+q^{2}\right), \\
c & =((m+n) p-(m-n) q)((m+n) q-(m-n) p), \\
d & =\left(m^{2}+n^{2}\right)\left(p^{2}-q^{2}\right), \\
e & =2 m n\left(p^{2}+q^{2}\right), \\
f & =2 p q\left(m^{2}+n^{2}\right) .
\end{aligned}
$$

Here are some examples with relatively small sides.

| $t_{1}$ | $t_{2}$ | $t$ | $a$ | $b$ | $c$ | $d$ | $e$ | $f$ | $\triangle$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $2 / 3$ | $1 / 2$ | $3 / 11$ | 65 | 25 | 33 | 39 | 60 | 52 | 1344 |
| $3 / 4$ | $1 / 2$ | $1 / 3$ | 25 | 7 | 15 | 15 | 24 | 20 | 192 |
| $3 / 4$ | $1 / 3$ | $2 / 11$ | 125 | 35 | 44 | 100 | 120 | 75 | 4212 |
| $6 / 7$ | $1 / 3$ | $1 / 4$ | 85 | 13 | 40 | 68 | 84 | 51 | 1890 |
| $7 / 9$ | $1 / 3$ | $1 / 5$ | 65 | 16 | 25 | 52 | 63 | 39 | 1134 |
| $8 / 9$ | $1 / 2$ | $3 / 7$ | 145 | 17 | 105 | 87 | 144 | 116 | 5760 |
| $7 / 11$ | $1 / 2$ | $1 / 4$ | 85 | 36 | 40 | 51 | 77 | 68 | 2310 |
| $8 / 11$ | $1 / 3$ | $1 / 6$ | 185 | 57 | 60 | 148 | 176 | 111 | 9240 |
| $11 / 13$ | $1 / 2$ | $2 / 5$ | 145 | 24 | 100 | 87 | 143 | 116 | 6006 |
