# Two Triads of Congruent Circles from Reflections 

Quang Tuan Bui

#### Abstract

Given a triangle, we construct two triads of congruent circles through the vertices, one associated with reflections in the altitudes, and the other reflections in the angle bisectors.

## 1. Reflections in the altitudes

Given triangle $A B C$ with orthocenter $H$, let $B_{a}$ and $C_{a}$ be the reflections of $B$ and $C$ in the line $A H$. These are points on the sideline $B C$ so that $\mathbf{B C}_{\mathbf{a}}=\mathbf{C B}_{\mathbf{a}}$. Similarly, consider the reflections $C_{b}, A_{b}$ of $C, A$ respectively in the line $B H$, and $A_{c}, B_{c}$ of $A, B$ in the line $C H$.

Theorem 1. The circles $A C_{b} B_{c}, B A_{c} C_{a}$, and $C B_{a} A_{b}$ are congruent.

Figure 1.

Proof. Let $O$ be the circumcenter of triangle $A B C$, and $X$ its reflection in the $A$-altitude. This is the circumcenter of triangle $A B_{a} C_{a}$, the reflection of triangle $A B C$ in its $A$-altitude. See Figure 2. It follows that $H$ lies on the perpendicular bisector of $O X$, and $H X=O H$. Similarly, if $Y$ and $Z$ are the reflections of $O$ in the lines $B H$ and $C H$ respectively, then $H Y=H Z=O H$. It follows that $O, X$, $Y, Z$ are concyclic, and $H$ is the center of the circle containing them. See Figure 3.

[^0]The author thanks Paul Yiu for his help in the preparation of this paper.

Figure 2

Figure 3

Let $O$ be the circumcenter of triangle $A B C$. Note the equalities of vectors

$$
\begin{aligned}
\mathbf{O X} & =\mathbf{B C}_{\mathbf{a}}=\mathbf{C B}_{\mathbf{a}}, \\
\mathrm{OY} & =\mathbf{C A}_{\mathbf{b}}=\mathbf{A C}_{\mathbf{b}}, \\
\mathrm{OZ} & =\mathbf{A B}_{\mathbf{c}}=\mathbf{B A}_{\mathbf{c}}
\end{aligned}
$$

The three triangles $A C_{b} B_{c}, B A_{c} C_{a}$, and $C B_{a} A_{b}$ are the translations of $O Y Z$ by OA, $O Z X$ by OB, and $O X Y$ by OC respectively.

Figure 4.

Therefore, the circumcircles of the three triangles are all congruent and have radius OH . Their centers are the translations of $H$ by the three vectors.

## 2. Reflections in the angle bisectors

Let $I$ be the incenter of triangle $A B C$. Consider the reflections of the vertices in the angle bisectors: $B_{a}^{\prime}, C_{a}^{\prime}$ of $B, C$ in $A I, C_{b}^{\prime}, A_{b}^{\prime}$ of $C, A$ in $B I$, and $A_{c}^{\prime}, B_{c}^{\prime}$ of $A, B$ in $C I$. See Figure 5 .

Theorem 2. The circles $A C_{b}^{\prime} B_{c}^{\prime}, B A_{c}^{\prime} C_{a}^{\prime}$, and $C B_{a}^{\prime} A_{b}^{\prime}$ are congruent.

Figure 5.

Proof. Consider the reflections $B_{c}^{\prime \prime}, C_{b}^{\prime \prime}$ of $B_{c}^{\prime}, C_{b}^{\prime}$ in $A I, C_{a}^{\prime \prime}, A_{c}^{\prime \prime}$ of $C_{a}^{\prime}, A_{c}^{\prime}$ in $B I$, and $A_{b}^{\prime \prime}, B_{a}^{\prime \prime}$ of $A_{b}^{\prime}, B_{a}^{\prime}$ in $C I$. See Figure 6.

Figure 6

Figure 7

Note the equalities of vectors

$$
\mathbf{B C}_{\mathbf{a}}^{\prime \prime}=\mathbf{C B}_{\mathbf{a}}^{\prime \prime}, \quad \mathbf{C A}_{\mathbf{b}}^{\prime \prime}=\mathbf{A C}_{\mathbf{b}}^{\prime \prime}, \quad \mathbf{A} \mathbf{B}_{\mathbf{c}}^{\prime \prime}=\mathbf{B A}_{\mathbf{c}}^{\prime \prime}
$$

With the circumcenter $O$ of triangle $A B C$, these define points $X^{\prime}, Y^{\prime}, Z^{\prime}$ such that

$$
\begin{aligned}
\mathbf{O X}^{\prime} & =\mathbf{B C}_{\mathbf{a}}^{\prime \prime}=\mathbf{C B}_{\mathbf{a}}^{\prime \prime}, \\
\mathbf{O Y}^{\prime} & =\mathbf{C A}_{\mathbf{b}}^{\prime \prime}=\mathbf{A C}_{\mathbf{b}}^{\prime \prime}, \\
\mathbf{O Z}^{\prime} & =\mathbf{A B}_{\mathbf{c}}^{\prime \prime}=\mathbf{B A}_{\mathbf{c}}^{\prime \prime} .
\end{aligned}
$$

The triangles $A C_{b}^{\prime \prime} B_{c}^{\prime \prime}, B A_{c}^{\prime \prime} C_{a}^{\prime \prime}$ and $C B_{a}^{\prime \prime} A_{b}^{\prime \prime}$ are the translations of $O Y^{\prime} Z^{\prime}, O Z^{\prime} X^{\prime}$ and $O X^{\prime} Y^{\prime}$ by the vectors $\mathbf{O A}, \mathbf{O B}$ and $\mathbf{O C}$ respectively. See Figure 7.

Note, in Figure 8, that $O X^{\prime} C_{a}^{\prime \prime} C$ is a symmetric trapezoid and $I C_{a}^{\prime \prime}=I C_{a}^{\prime}=$ $I C$. It follows that triangles $I C_{a}^{\prime \prime} X^{\prime}$ and $I C O$ are congruent, and $I X^{\prime}=I O$. Similarly, $I Y^{\prime}=I O$ and $I Z^{\prime}=I O$. This means that the four points $O, X^{\prime}, Y^{\prime}$, $Z^{\prime}$ are on a circle center $I$. See Figure 9. The circumcenters $O_{a}^{\prime \prime}, O_{b}^{\prime \prime}, O_{c}^{\prime \prime}$ of the triangles $A C_{b}^{\prime \prime} B_{c}^{\prime \prime}, B A_{c}^{\prime \prime} C_{a}^{\prime \prime}$ and $C B_{a}^{\prime \prime} A_{b}^{\prime \prime}$ are the translations of $I$ by these vectors. These circumcircles are congruent to the circle $I(O)$.

Figure 8

Figure 9

The segments $A O_{a}^{\prime \prime}, B O_{b}^{\prime \prime}$ and $C O_{c}^{\prime \prime}$ are parallel and equal in lengths. The triangles $A C_{b}^{\prime} B_{c}^{\prime}, B A_{c}^{\prime} C_{a}^{\prime}$ and $C B_{a}^{\prime} A_{b}^{\prime}$ are the reflections of $A C_{b}^{\prime \prime} B_{c}^{\prime \prime}, B A_{c}^{\prime \prime} C_{a}^{\prime \prime}$ and $C B_{a}^{\prime \prime} A_{b}^{\prime \prime}$ in the respective angle bisectors. See Figure 10. It follows that their circumcircles are all congruent to $I(O)$.

Let $O_{a}^{\prime}, O_{b}^{\prime}, O_{c}^{\prime}$ be the circumcenters of triangles $A C_{b}^{\prime} B_{c}^{\prime}, B A_{c}^{\prime} C_{a}^{\prime}$ and $C B_{a}^{\prime} A_{b}^{\prime}$ respectively. The lines $A O_{a}^{\prime}$ and $A O_{a}^{\prime \prime}$ are symmetric with respect to the bisector of angle $A$. Since $A O_{a}^{\prime \prime}, B O_{b}^{\prime \prime}$ and $C O_{c}^{\prime \prime}$ are parallel to the line $O I$, the reflections in the angle bisectors concur at the isogonal conjugate of the infinite point of $O I$. This is a point $P$ on the circumcircle. It is the triangle center $X_{104}$ in [1].

Finally, since $I O_{a}^{\prime \prime}=I O_{b}^{\prime \prime}=I O_{c}^{\prime \prime}$, we also have $I O_{a}^{\prime}=I O_{b}^{\prime}=I O_{c}^{\prime}$. The 6 circumcenters all lie on the circle, center $I$, radius $R$.

Figure 10.
To conclude this note, we establish an interesting property of the centers of the circles in Theorem 2.
Proposition 3. The lines $O_{a}^{\prime} I, O_{b}^{\prime} I$ and $O_{c}^{\prime} I$ are perpendicular to $B C, C A$ and $A B$ respectively.

Figure 11.

Proof. It is enough to prove that for the line $O_{a}^{\prime} I$. The other two cases are similar.
Let $M$ be the intersection (other than $A$ ) of the circle $\left(O_{a}^{\prime}\right)$ with the circumcircle of triangle $A B C$. Since $I O_{a}^{\prime}=O M$ (circumradius) and $O_{a}^{\prime} M=I O, O_{a}^{\prime} M O I$ is a parallelogram. This means that $\mathbf{O}_{\mathbf{a}}^{\prime} \mathbf{M}=\mathbf{I O}=\mathbf{O}_{\mathbf{a}}^{\prime \prime} \mathbf{A}$, and $A M O_{a}^{\prime} O_{a}^{\prime \prime}$ is also a parallelogram. From this we conclude that $A M$, being parallel to $O_{a}^{\prime \prime} O_{a}^{\prime}$, is perpendicular to the bisector $A I$. Thus, $M$ is the midpoint of the arc $B A C$, and $M O$ is perpendicular to $B C$. Since $\mathbf{O}_{\mathbf{a}}^{\prime} \mathbf{I}=\mathbf{M O}$, the line $O_{a}^{\prime} I$ is also perpendicular to $B C$.

Since the six circles $\left(O_{a}^{\prime}\right)$ and $\left(O_{a}^{\prime \prime}\right)$ etc are congruent (with common radius $O I$ ) and their centers are all at a distance $R$ from $I$, it is clear that there are two circles, center $I$, tangent to all these circles. These two circles are tangent to the circumcircle, the point of tangency being the intersection of the circumcircle with the line $O I$. These are the triangle centers $X_{1381}$ and $X_{1382}$ of [1].
